

Hazards in the Greenhouse

1. Watch out for water on the floor. Puddles and wet spots should be marked with a wet floor sign.
2. Pesticides and other chemicals should be applied using personal protective equipment. Hazardous chemicals should never be applied without gloves.
3. Exposed electrical outlets can be dangerous in a greenhouse. All outlets should be installed with the proper safety cap.
4. Algae growth is common in greenhouses with concrete floors. If the algae goes untreated, it can become a slipping hazard.
5. The water hose and other equipment should be picked up and put away. If left out, it can present a tripping hazard.
6. There is no horseplay in the greenhouse! It is very possible that someone could get hurt.
7. Broken roof panes and side panels can cause a number of problems. They should be replaced to prevent being cut by broken glass.
8. There should be no open toe shoes in the greenhouse. Closed-toe, non-slip shoes work best.
9. Monitor the temperature in the greenhouse. It can be hot and workers should always make sure to drink enough water to stay hydrated.
10. If the weather is bad (windy, hail, lightning), people in a greenhouse should move to a permanent structure, like a house or school.
11. No eating in the greenhouse. When working in a greenhouse, hands and surfaces are often dirty and may expose you to harmful bacteria or chemical residue.

Augmentive Communication Cards

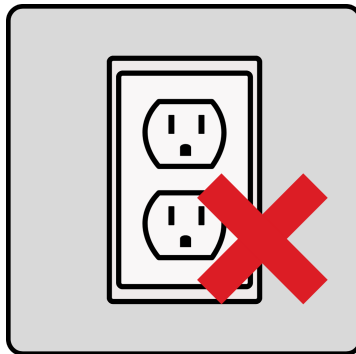

1. Watch out for water on the floor. Puddles and wet spots should be marked with a wet floor sign.

2. Pesticides and other chemicals should be applied using personal protective equipment. Hazardous chemicals should never be applied without gloves.
